Job Screener

Automation flow: from job alert emails to a daily shortlist

The Problem

Reviewing job alert emails and manually transferring them to ChatGPT required repetitive work and was easy to postpone or forget. The goal was to identify opportunities aligned with my experience, location, and career preferences.

Tools

Gmail	UiPath	Google Drive	ChatGPT scheduled tasks
Receives and labels alerts	Reads emails, saves text files	Stores the files	Screens opportunities

Workflow Triggers

Trigger	What happens
Email processing	A LinkedIn job alert arrives in Gmail and receives the designated label.
Job screening	A scheduled ChatGPT task runs daily at 2 PM.

How It Works

1. Gmail filters automatically apply the "LinkedIn Job Alerts" label to incoming job alert emails.
2. UiPath reads the email contents and uploads them as a text file to a designated Google Drive folder.
3. At the scheduled time, ChatGPT retrieves the most recently modified text file through its Google Drive connection.
4. ChatGPT evaluates the opportunities against predefined screening criteria, including experience, location, and career alignment, and reports suitable prospects for review.

Impact

Eliminates the manual process of saving job alert emails as PDFs and uploading them to ChatGPT, saving at least five minutes per manual transfer replaced. Scheduled screening reduces reliance on remembering to initiate the review.

Human Review

I review the screening results, decide which opportunities to pursue, and submit applications.
